Project Statement: Aqua Safe

Project Title: Aqua Safe a Machine Learning System for Water Portability Analysis

Domain: Environment & Sustainability / Data Science

Name: Aaryan Saxena

Registration Number: 25BCE10619

1. Problem Statement

Safe drinking water is essential for human health and survival. However, rapid industrialisation and environmental degradation have led to fluctuating water quality standards. Traditional methods of determining water potability involve:

- Manual collection of samples.
- Laboratory testing which is time-consuming and expensive.
- High dependency on human expertise, leading to potential delays and errors.

There is a lack of automated, low-cost computational tools that can instantly analyse complex physicochemical parameters to determine if a water source is safe for consumption.

2. Proposed Solution

AquaSafe is a data-driven software solution designed to automate the evaluation of water quality. By leveraging Machine Learning techniques, specifically the **Random Forest Classifier**, the system analyses historical water quality data to identify patterns between chemical attributes (such as pH, Hardness, and Chloramines) and potability.

The system takes raw sensor data as input and provides a binary classification:

- **1 (Potable):** Safe for human consumption.
- **0 (Not Potable):** Unsafe/Requires treatment.

3. Key Objectives

- **Data Analysis:** To perform Exploratory Data Analysis (EDA) on water quality datasets to understand the correlation between chemical factors and safety.
- **Preprocessing:** To implement robust data cleaning techniques, including the imputation of missing values and standardisation of feature scales.
- **Model Development:** To design and train a supervised learning model capable of predicting water safety with high accuracy.
- **Visualisation:** To generate graphical representations (Heatmaps, Confusion Matrices) that make the data interpretable for non-technical users.

4. Technical Stack & Libraries

This project is built using Python 3.x and relies on the following specialised libraries to handle data processing, machine learning, and reporting:

Library	Role in Project
pandas	Used for data ingestion (reading CSVs) and manipulation (Data Frames).
numpy	Utilized for high-performance numerical calculations and array handling.
scikit-learn	The core library for Machine Learning. It provides the **Random Forest Classifier**, **StandardScaler** (normalization), **SimpleImputer** (missing value handling), and evaluation metrics.
matplotlib	Used to generate the base figures for data visualization.
seaborn	Used on top of Matplotlib to create aesthetic statistical graphs, specifically the Correlation Heatmap and Confusion Matrix.
python-docx	A utility library used to programmatically generate the final MS Word (.docx) project report.

5. Methodology

The project follows a modular development process:

1. **Data Ingestion:** The system loads water quality data from a CSV file.
2. **Preprocessing:** Null values are filled using mean imputation, and data is scaled to normalise distributions.
3. **Training:** The Random Forest algorithm is trained on 80% of the dataset to learn the relationship between chemical features and potability.
4. **Validation:** The model is tested on the remaining 20% of data to ensure accuracy.
5. **Deployment:** The system offers a manual testing mode where users can input specific sensor readings to get an instant prediction.

6. Scope and Limitations

- **Scope:** The project is limited to the software analysis of pre-recorded datasets. It simulates the decision-making process of a water quality monitoring station.
- **Limitation:** The current system relies on a static dataset. Real-time analysis would require physical integration with IoT sensors, which is a subject for future expansion.

7. Expected Outcome

The successful execution of this project will result in a functional Python application that can:

1. Ingest and clean water quality data.
2. Accurately predict safety status (Safe vs. Unsafe).
3. Generate visual performance reports.
4. Create a downloadable project document automatically.

Student Declaration

I hereby declare that this project is my own work and has been developed by applying the concepts learned in the course. All code, logic, and documentation have been written/compiled by me, and external libraries used have been properly cited.
